

1                   ABSTRACT OF THE DISCLOSURE

2                   A renewable sponge. A body includes a non-abrasive layer and an  
3                   abrasive layer that overlies, and is attached to, the non-abrasive layer.  
4                   Each of the non-abrasive layer and the abrasive layer include a plurality  
5                   of peel-off layers that are substantially separated from each other by  
6                   strategically positioned slits so as to allow each of the plurality of  
7                   peel-off layers to be peeled off when exhausted and expose a next peel-off  
8                   layer so as to renew the renewable sponge. The strategically positioned  
9                   slits extend between adjacent ones of the plurality of peel-off layers  
10                  completely across the body, from one side of the body to the other side  
11                  of the body. The strategically positioned slits that are between adjacent  
12                  layers of the plurality of peel-off layers are separated from each other  
13                  by non-slitted portions of the body.
